A Few Stats

African Americans have lower flu vaccination rates than any other group in the U.S. According to the Centers for Disease Control (CDC), only 22% of African Americans got the vaccine for the 2019-2020 season. By contrast, 50% of White non-Hispanic populations got the vaccine. That means there are more than twice as many African Americans who have not yet been vaccinated. 

Cancer patients are also at risk of flu complications. According to the National Cancer Institute, 60% of cancer patients have a higher risk of severe complications from flu and may be more susceptible to flu.
